## Abstract :

Most chronic diseases are psychosomatic, resulting from chronic maladaptive stress derived from prolonged negative mental health states, often subconscious, which disregulate physiological functions. Emotions are biochemistry manifestations of the mind and thinking. We change mental health and chronic diseases by updating beliefs and thinking and providing the body with fundamental cellular nourishment.

**Keywords** : stress, chronic disease, mental health, mind, holistic therapy, emotions, perception, biofeedback, nutrition, Consciousness.

## Introduction :

Our beliefs, thinking and emotions directly impact both psyche and physical well-being, including the reality experienced, as evidenced by the fields of psychoneuroimmunology (PNI) and epigenetics. Most of the diseases faced today are due to prolonged negative mental states, resulting in chronic stress that creates a disbalance within our biochemical homeostatic balance, producing disease. Health is more than the absence of disease. Body and mind are integrated with lifestyle, including nutrition, social structure, exercise, mindset, and spirituality, to attain or regain proper balance (1). Chronic stress is directly proportional to our subconscious beliefs driving our thoughts, eliciting neurochemical sensations and feelings in our body, which we label emotions after assigning meaning to them and activating our behaviours (2). The scientific fields from which conventional medicine stems tend to work in isolation with little intercommunication and collaboration, resulting in segregated operations with a lack of overall root-cause understanding.

## Mind-Body & Emotions :

Emotions underpin most of the stress we experience, which essentially arouses our actions, influences our decisions and defines our quality of life (2; 3), with current data revealing that there are more afferent than efferent pathways from the heart to the brain. Stimuli cause emotional responses which affect and direct our attention equal to the stimuli, known as the mood-congruity effect (4; 5). Emotions also play a critical role in our memory formation and learning abilities, known as emotion-state-dependent memory; thus, we tend to retain more information in more positive states than negative mental states (6; 7; 8; 9). How we react to external stimuli varies significantly from person to person. Stress results from our perception of an event and the meaning we assign to such events (10). However, meaning is relative, subjective, and often created from associations between experiences and learning (11; 12). Much of how we perceive the world around us is due to our beliefs, which create a lens that colours and filters information to match our internal beliefs; as such, we tend to see things in a distorted way, not

necessarily as they are (2; 12; 13; 14; 15). Hence, we observe not nature or reality, but rather nature and reality exposed to our unique observation and questioning method. Current studies agree that cognition and emotions are interrelated neural systems in dynamic interaction (16; 17). Furthermore, neuroscience has discovered links between cognitive centres and emotional processing within the brain. For example, hardwired in the brain are bidirectional neural connections between the frontal cortex and amygdala, modulating activity and processing (18; 19; 20). Neurochemical biological links in the cortex contain large quantities of receptors for neuropeptides that are also condensed in the subcortical areas associated with emotional processing, suggesting that these links are crucial for a full spectrum of mental faculties (21; 22). Likewise, there are substantially more neural connections from the emotional processing areas to the cognitive centres than in the opposite direction (20).

## **Stress :**

Regarding health, stress can be viewed physically, chemically, or emotionally (psychologically). Physical stress is a physical injury where the physical body is structurally affected. Chemical Stress includes toxins, pollutants, and so forth. Emotional stress is psychological. However, all forms of stress result in emotional stress in humans (11). Chronic stress is recognised as a pandemic resulting in premature death (23). Studies indicate that over 90% of physician visits are related to chronic stress, such as high blood pressure, headaches, digestive issues, chronic pain, sleep disruptions, cardiovascular issues, and metabolic syndrome (24; 12; 25). Furthermore, chronic stress is the leading cause of physiological and psychological diseases, including cancer and autoimmune diseases (12; 26); therefore, most diseases seem psychosomatic. Stress deviates from homeostasis by shifting to the fight, flight or freeze response (FFF) initiated by the sympathetic nervous system (SNS). The SNS results in a protective mode; thus, all energy and resources are diverted to the extremities to enable the body to fight, run or fully freeze to evade the life-threatening danger and imminent peril. Humans have an uncanny ability to use their imagination to incite the SNS FFF response and initiate the same perceived threat levels in the body, even though no looming life-threatening danger may exist (27; 12; 28; 24). Humans are uniquely equipped with a large neocortex that allows us to use our imagination and make it appear equally real to our external environment. Hence, we can engage the SNS response equally through thought alone (11; 12; 27). Our stress response is an evolutionary acquisition that enables instant mobilisation to evade impending dangers and threats to survive. It is designed to be a short-term acute response mechanism with which all species have evolved to endure predators and other threats.

However, the constant bombardment of stress responses results in biochemicals that disregulate homeostatic balance over time (28; 11; 26; 12). As a result, cellular repair, regeneration, rest, and proper gene functioning cease to perform correctly because all energy is diverted into a protective mechanism versus growth and repair, shunting resources for healing. Heart disease, cancer, asthma, diabetes, high blood pressure, high cholesterol, headaches, Alzheimer's, Parkinson's, Multiple Sclerosis, autoimmune, chronic, inflammatory, neurological issues, strokes, impotence, and almost all other physiological diseases to a large degree result from chronic stress (2; 12; 29; 30).

## **Genes & Epigenetics :**

Genetic disposition as the primary argument for diseases has been predominantly disproven since about 2003 after the Human Genome Project discovered that we have 23,688 genes, which cannot account for the multitude of various genetic protein expressions each human possesses (11; 12). However, each gene can create 3000 or more variations of proteins from the same gene blueprint (31; 32; 12). The field of Epigenetics states that "single gene disorders affect less than one per cent of the population" (12 p. 20) and rarely is one gene responsible for a disease. Genes are not auto-activated but await a signal to either up-regulate or down-regulate. Several genes, from Immediate Early Genes, activated in seconds, Behavioural State-Related Genes linking our mind to our body, and Experience Dependent Genes activated by learning (33), reveal how the mind controls the body's genes and physiology.

## **Nutrition & Lifestyle :**

The Western diet is notoriously unhealthy and leads to disease (34; 35; 36). Nutrition is fundamental to mind and body health (1). The microbiome affects our mental, emotional and physiological states via the gut-brain axis (37; 38). Orthomolecular medicine supplements of vitamins, minerals, enzymes, and probiotics naturally aid in restoring balance and health because they are the building blocks of cellular structures. Additionally, movement and various forms of activity over sedentary lifestyles boost health outcomes, improve the mind, and reduce stress (39; 40). Moreover, sunlight, positive social interactions and adequate sleep are key health and overall well-being variables.

## **Methodology Philosophy :**

An interpretive philosophy (41) is taken in a semi-structured psychological discussion conducted to develop a more robust theoretical perspective on the already existing literature in conjunction with the Grounded Theory method

to “develop explanations of social interactions and processes” (42) that lead to negative mental states creating chronic stress and resulting in various diseases. It addresses the less tangible belief structure to gain better insight into particular scenarios that individuals experience. Finally, psychological interviews allow respondents to formalise, in their own words, answers more closely aligned to their beliefs, which produces a way of thinking and leads to emotions equal to their thoughts.

### **Theory Development :**

A deductive approach, coupled with a descripto-explanatory study (42), is used for data collection in the form of a self-reported historical background examination with each participant and compared against existing research to determine correlations allowing for generalised conclusions (43). The data is anonymised to reduce response bias, stigma, and socially acceptable answers. Confidentiality is ensured by assigning case study numbers to participants and only having the researcher aware of the identities (44).

### **Data Collection Strategy :**

The study is a cross-sectional analysis using a concurrent mixed-method qualitative and quantitative data collection technique (42; 45), supplemented upon longitudinal studies offered in the Literature Review, to explore the effects of negative mental states leading to chronic stress and their association with various psychological and physiological diseases to assess the psychosomatic aspect. The study analyses data gathered from both sexes owing to a mutually inclusive correlation in negative mental states, chronic stress, and diseases equally affecting both but with varying diseases. Quantitative methods allow social researchers to quantify our world systematically (46). Such results may be applied more generally, and relationships among variables are easily examined. Its drawback is that it provides statistical generalities limiting the number of choices for individuality, which may cause a muddled reflection of the respondent's true beliefs, hence the use of qualitative methods. Biofeedback methods of EEG using Muse and heart rate variability (HRV) by HearthMath technology are utilised for quantitative data analysis with breathwork and meditative instructions.

### **Reliability & Validity :**

Each participant is requested to confirm, comment, and describe the process, outcomes and overall successes and failures in their own words, allowing unbiased feedback and input for additional integrity. Internal validity is confirmed by the case studies demonstrating the relationships between negative mental states leading to chronic stress and the

effects on physiology causing disease and the reversals and reductions of such diseases and chronic stress with implementing positive mental states.

### **Ethics & Consent :**

General and research ethics guidelines and the additional regional, Alberta-based stringent ethics regulations and laws were followed to ensure moral conduct. The researcher used a ‘participant consent form’ that all study members signed, ensuring informed consent and understanding of the study. Additionally, complete anonymity was provided for the study, with members assigned a case study number. Furthermore, no incentives were offered, reducing ethical issues and social bias and certifying voluntary participation.

### **Case Studies (n-8) :**

There were a total of eight participants who had various psychological issues and physiological chronic diseases. There were several core requirements for all to follow as closely as possible for twelve weeks or as long as they remained within the study recommended for optimal results, as follows:

- Using a strong probiotic (200 billion counts or more) with a large variety of species and a 70% raw diet of fruits and vegetables to feed the microbiota and optimise the gut microbiome with adequate detoxification (47). Preferably, fruits and vegetables are organic, non-GMO and pesticide-free.
- Individualised orthomolecular and herbal medicines are required for each participant presenting health issues in the mind and body.
- No gluten or American dairy products to reduce inflammation and gastrointestinal issues. However, full-fat and sugar-free cottage cheese, Greek yoghurt, and European and fermented cheeses are welcome in moderation.
- Limit red meat to once per week, poultry to twice weekly, and seafood as often as possible to reduce saturated fats, detoxify the blood and cleanse the gastrointestinal system. Ideally, the meats, poultry and seafood are fresh, wild, free-range, hormone-free, and lean.
- Eat plenty of legumes, nuts, seeds, and olive oils for healthy fats.
- Daily moderate-intensity movement for half an hour to one-hour boosts nitric oxide (NO), promoting neuroplasticity by producing brain-derived neurotrophic factors (BDNF). However, excessive and intense exercise is equally destructive to the body and mind as no movement and is often observed in extreme athletes (48; 49), producing mental and oxidative stress.

- Daily Buddha Belly Box Breath for ten minutes upon waking and before bed. An additional ten minutes of mantra meditation after the breathwork was required to optimise healing. Plus, an additional five to ten minutes as needed throughout the day when negative mental states or feelings of stress arise.
- Journaling with an emphasis on gratitude to reframe neural circuitry.
- No watching the news or watching action, horror, thrillers, drama shows or movies that subconsciously trigger the body's stress response. But a minimum of twenty minutes of daily comedies and laughter.
- No listening to heavy metal or negative lyrics. However, daily listening to uplifting music.
- Socialising with people who uplift and support and limit or eliminate toxic individuals.
- Practice a hobby that brings passion and creativity at least twice a week.
- No alcohol consumption.
- Drink 3 litres of water and teas, emphasising green and herbal teas.
- Avoid news, action, horror, thriller, and drama movies and TV shows that may subconsciously stress you. Daily comedy and laughter must last 20 minutes.
- Do not gossip or speak ill against others, and stop complaining about life except in session as needed; talk about ambitions, goals, aspirations, and the positive aspects of life to reframe negativity to positivity by rewiring the brain and heart's neural synaptic connections.
- A minimum of eight hours of sleep per night, aiming for sleep by 10 PM, because from 10 to 1 PM, we generate the highest levels of the human growth hormone (HGH), and between 1 and 4 AM, we generate the highest levels of melatonin (50). Thus, we engage the body's innate ability for cellular repair and regeneration and the precursor for serotonin.
- Biofeedback readings and analysis of EEG and HRV.

## Case Study 1:

### 40-year-old German-Canadian male

**Married:** no children

**Height:** 6'4"

**Weight:** 220 pounds

**Education:** Bachelor's Degree

**Self-employed:** CEO and President of a recruiting firm. He additionally coaches basketball for young adults.

**Religion/Spirituality:** Atheist

**Total face-to-face sessions:** 7 sessions

**Total hours of face-to-face sessions:** 27 hours

**Emails time over roughly 3 months:** 5 hours

**Pharmaceutical medications, dosage and frequency :**

**Symbicort:** as needed, usually once per day

**Reactine:** as needed, usually once a week

**Sertraline:** 150mg daily

**Non-pharmaceutical medications, dosages and frequency :**

**Marijuana:** eatables daily for sleep and relaxation

**Supplements :** None

**Initial blood pressure :** 150/93 @ 62 BPM baseline (Stage 2 hypertensive).

**Perceived Stress Scale (PSS) :** 3 by his account, 8 by the researcher

**Smoking :** No, never

**Psychological :**

- Severe generalised anxiety (GAD), PTSD, insomnia, mild depression, panic attacks, racing thoughts, fear, self-sabotage, procrastination, low self-esteem, low self-confidence, anger, control issues, fear of change, guilt, memory issues, sexual dysfunction, impulsivity and risk-taking.
- Addictions to gambling every week or two and alcoholism from Thursday to Sunday each week.

**Physiological :**

- Gastrointestinal issues: acid reflux, diarrhoea, and a general upset stomach. Furthermore, body aches (generalised pain), chronic fatigue and low energy, hypertension, asthma issues, and seasonal and animal allergies.

**Nutrition/Diet and Exercise:**

- He consumed fast food roughly twice weekly and ate a diet full of red meat, simple carbohydrates, and starches, with no vegetables and minimal fruit since he disliked them.
- He typically weight trains up to five times per week but had stopped for several months because he was too tired and had no motivation to move.

**Employment :**

- He does not enjoy his work. He finds that the people he negotiates with lack empathy and are driven by profit and money with little regard for people, which does not agree with his moral compass.

**Relationships/Social Network :**

- Unfulfilled in marriage, he is not happy or unhappy. "She's perfect; she makes a lot of money, lets me do whatever I want, looks after everything, she's pretty and smart."
- Social network consists of the same friends from childhood.
- Avoids parents and not a good relationship.

**Results Post Session :****Pharmaceutical medications, dosage and frequency:**

- **Symbicort:** as needed, usually once per day = zero
- **Reactine:** as needed, usually once a week = zero
- **Sertraline:** 150mg daily = zero

**Non-pharmaceutical medications, dosages and frequency:**

- **Marijuana:** eatables once every three or more days = Reduction from daily - 2/7 per week = 71% reduction

**Initial versus current blood pressure :** 117/77 @ 65 BPM baseline. No more hypertension.

**Perceived Stress Scale (PSS) :** 2 by his account; the researcher concurs.

**Psychological:**

- Severe generalised anxiety (GAD) and PTSD = absent.
- From daily episodes of panic attacks to 0 for 8 weeks.
- Insomnia = absent. He sleeps through the night and wakes rested.
- Racing thoughts, fear, anger, control issues, procrastination, memory issues, impulsivity, self-sabotage, risk-taking and mild depression = absent.
- Gambling and alcoholism = remission for over eight weeks. He no longer feels the desire to drink and states, "I see things so much clearer and different now."
- Sexual dysfunction = absent
- Low self-esteem, low self-confidence, fear of change, guilt, and require additional sessions.

**Psychological :**

- Gastrointestinal issues: acid reflux, diarrhoea, and a general upset stomach = vanished.
- Body aches, chronic fatigue, low energy, hypertension, and asthma issues = vanished.

- Seasonal and animal allergies = significantly reduced from weekly episodes to once every two to three weeks.

**Nutrition/Diet and Exercise :**

- He no longer consumes fast food, eats much more vegetables and fruits, including a smoothie each morning, and reduces red meat to twice per week.
- He restarted weight training up to five times per week.

**Employment :**

- Although he does not enjoy his work, he has learned to find positives in daily tasks and holds more patience and compassion for his colleagues, making negotiating easier and less stressful. He is also considering retiring from his position as a recruiter and working as a full-time basketball coach to follow his passion.

**Relationships/Social Network :**

- Unfulfilled in marriage, he is not happy nor unhappy = resolved.
- He has sober sexual intercourse with his wife and feels closer to her.
- His social network consists of the same friends from childhood, but he has told them that he is a recovering alcoholic and thus needs their support.
- He has resumed a healthy, talkative relationship with his mother, speaks for hours a couple of times per week, and arranges visits.
- Historically, he could never cry, and he believes he has not since he was under seven. However, he has managed to cry three times, releasing suppressed emotions from childhood.

CS1 learned why his father's violence and affairs led to his fear of change, inability to recognise healthy relationships and love, insecurity, panic attacks, lack of self-esteem and general psychological issues. Additionally, CS1 recognised how the alcohol, gambling, and sexual encounters were his coping mechanisms to avoid facing the hurt and pain he subconsciously held onto from childhood while giving him a dopamine kick and that the anger he had was a mask for buried sadness. Moreover, CS1 learned about the mind-body connection and how negative mental states result in negative biochemicals of emotions, causing various diseases and health issues. He reportedly "feels high" and euphoric when he meditates. He is no longer angry from suppressing sorrow and fear but rather joyful and feels more in control and at peace. He feels more in control of his mind. Moreover, he understands how his childhood traumas and issues manifested the psychological issues he exhibited prior to the psychological sessions and protocol.

## Case Study 2 :

**19-year-old Anglo-Saxon female.**

**Boyfriend :** no children.

**Height :** 5'6"

**Weight :** 109 pounds (underweight)

**Education :** High School

**Employment :** Hairstylist and Waitress

**Religion/Spirituality :** Atheist

**Total face-to-face sessions :** 12 sessions

**Total hours of face-to-face sessions :** 32 hours

**Total texts time over roughly 3 months:** 9 hours

**Pharmaceutical medications, dosage and frequency:**

**Ritalin:** 100mg daily

**Non-pharmaceutical medications, dosages and frequency :**

**Marijuana:** eatables daily for sleep, pain and relaxation and smoking every hour.

**Supplements :** o None

**Initial blood pressure :** 122/81 @ 75 BPM baseline.

**Perceived Stress Scale (PSS) :** 9, by her account, and the researcher concurs.

**Smoking :** No, never, but vaping nicotine three to four times per hour.

**Psychological :**

- Severe generalised anxiety (GAD), PTSD, ADHD, insomnia, depression, racing thoughts, fear, self-sabotage, procrastination, anger, control issues, memory issues, chronic fatigue, stress, impulsivity and risk-taking.

- Eating Disorder and Addiction to Nicotine and Marijuana.

- Self-harm: cutting her arms.

**Psychological :**

- Chronic spinal pains from past gymnastics and Thai Boxing injuries.

- Respiratory issues: coughing, wheezing, and difficulty breathing.

**Nutrition/Diet and Exercise :**

- She consumed fast food roughly four times weekly and ate little to no vegetables or fruit. She also mainly ate junk food and food-like substances.

- She used to be a Thai-Boxer fighter and gymnast but gave it up due to spinal pain and lack of money.

**Employment :**

- She works as a part-time hairstylist and waitress. She seems to enjoy it but complains of pain in her back from standing for long hours.

**Relationships/Social Network :**

- No relationship with her biological mother

- Good relationship with her stepmother.

- Strained relationship with her father.

- Has two half-brothers; they are not very close.

- She has a romantic relationship with a boyfriend but is insecure and unhappy.

- Best friend since childhood; very close and healthy support.

- She is Bi-Sexual.

**Results Post Session :**

- **Weight:** 123.5 pounds (gained 14.5 pounds).

**Pharmaceutical medications, dosage and frequency:**

- **Ritalin:** 100mg daily = zero

**Non-pharmaceutical medications, dosages and frequency :**

- Reduced Marijuana eatables to once per week = 86% reduction.

- Reduced smoking to twice nightly

**Initial blood pressure :**

- 102/79 @ 60 baseline

**Perceived Stress Scale (PSS) :**

- 4 by her account, the researcher concurs.

**Smoking :**

- No, never, but vaping nicotine three to four times per hour = vaping once every two to three hours.

**Psychological :**

- Severe generalised anxiety (GAD), PTSD, ADHD, insomnia, depression and stress = substantially minimised.

- Racing thoughts, fear, self-sabotage, procrastination, anger, control issues, memory issues, chronic fatigue, impulsivity and risk-taking = absent.

- Eating disorders and addiction to Nicotine and Marijuana = significantly reduced.
- Self-harm: cutting her arms = absent.

### Physiological:

- Respiratory issues: coughing, wheezing likely due to vaping and smoking Marijuana require more assistance and time.

### Nutrition/Diet and Exercise :

- She consumed fast food roughly four times weekly and ate little to no vegetables or fruit. She also mainly ate junk food and food-like substances = She eats some vegetables and fruit with every meal and snack. She finds what is on sale and buys frozen vegetables and fruits to steam to save some money.
- She used to be a Thai-Boxer fighter and gymnast but gave it up due to spinal pain and lack of money = She is back to some weight training at home and walks daily. She also practices some Thai boxing at home.

### Employment :

- She works as a part-time hairstylist and waitress. She seems to enjoy it but complains of pain in her back from standing for long hours = the pain has dramatically subsided.

### Relationships/Social Network :

- No relationship with her biological mother = Still the same, and for the best.
- Good relationship with her stepmother = Becoming stronger as she sets boundaries.
- Strained relationship with her father = Improving but setting boundaries.
- Has two half-brothers; they are not very close = Advancing as she understands their habits.
- Has a romantic relationship with a boyfriend, but he is insecure and unhappy = Separated from him and feels better being single and focusing on her overall health.
- Best friend since childhood; very close and healthy support = Same.
- She is Bi-Sexual = She seems to recognise that she may be lesbian. Therefore, she plans to pursue more females.

CS2 learned how her traumatic childhood surrounded by drugs, unknown men, and complete neglect resulted in her inability to self-regulate her mind and emotions or learn the basic concepts of human existence.

Moreover, CS2 understood how her anger was her mask of deep sorrow and pain and that her psychological issues stemmed from her upbringing. CS2 also understood how nicotine and Marijuana are coping tools to suppress emotional turmoil and that the cutting was her way of attempting to gain some control of her life and express her inner pain. In addition, CS2 learned about the mind-body connection and how negative mental states result in negative biochemicals of emotions, causing various diseases and health issues. CS2 feels much calmer and in control of her mind and behaviour. She feels as though she can focus better when she does her breathwork. She also feels much more relaxed, and her back pain has significantly reduced from all the time to a couple of times per week. She also noticed that her pains become more aggravated when stressed and negative. She noted that she enjoys doing the breathwork while driving, at work and when anyone frustrates her, especially when she feels anger rising. Additionally, she sleeps well and through the night, feeling refreshed when she wakes in the morning. She is finding herself less reactive.

### Case Study 3 :

#### 40-year-old Anglo-Saxon female.

**Married:** no children.

**Height:** 5'5"

**Weight:** 125 pounds

**Education:** Nutrition Certificate

**Sel-Employed:** Owns a construction business with her husband

**Religion/Spirituality:** Atheist

**Total face-to-face sessions:** 12 sessions

**Total hours of face-to-face sessions:** 39 hours

**Total texts/emails time over roughly 3 months:** 2 hours

**Pharmaceutical medications, dosage and frequency:**

**Aleve:** used every second day for back pain.

**Non-pharmaceutical medications, dosages and frequency :** None.

**Supplements :** Glutamine, creatine, multivitamin, lysine, ashwagandha, curcumin, and probiotics.

**Initial blood pressure :** 136/85 @ 52 BPM baseline (Stage 1 hypertension).

**Perceived Stress Scale (PSS) :** 9 by her account, and the researcher agrees.

**Smoking:** No, Never.

**Physiological:**

- Anxiety, lack of self-confidence and esteem, procrastination, stress, sleep disruptions, guilt, regret, self-sabotage, racing thoughts, chronic fatigue, and memory issues.

**Physiological:**

- Chronic lower spinal and pelvic pain from a biking injury resulting in surgery.
- PMS pains, Irritable bowel syndrome (IBS), Gastritis, Asthma

**Nutrition/Diet and Exercise :**

- Weight training and HIIT practitioner, but very limited owing to chronic back pain.
- Nutritionist so eats quite healthfully and rarely drinks any alcohol.

**Employment :**

- Runs a construction business with her husband. She does the books and manages the project. She does not dislike it, but this is not where her heart resides. Additionally, she feels unsettled with her husband's approach because he is illiterate about business but good with sales, which causes friction.

**Relationships/Social Network :**

- CS3 is unhappily married. She sees him as her best friend, but their marriage has no romantic aspect. CS3 would like a divorce.
- CS3 has one female best friend with whom she can confide and be open.
- CS3 has no other social circles as her husband becomes jealous, causing arguments. Even if she has female friends, "he gets jealous and asks me if I'm turning lesbian, and why we can't just have the same friends only."
- She cannot join networking groups or social classes because he fears her leaving him.
- CS3 was a Jehovah's Witness believer.

**Results Post Session :****Pharmaceutical medications, dosage and frequency:**

- **Aleve:** reduced to once every second week.

**Initial blood pressure :**

- 113/79 @ 52 baseline (no slight hypertension).

**Perceived Stress Scale (PSS) :**

- 3 by her account, and the researcher concurs.

**Psychological :**

- Anxiety, lack of self-confidence and esteem, procrastination, stress, sleep disruptions, guilt, regret, self-sabotage, racing thoughts, chronic fatigue, and memory issues = absent

**Psychological :**

- Chronic lower spinal and pelvic injury resulting in surgery = she does not feel nearly as much pain or discomfort.
- PMS pains = no more pain and regained emotional control.
- Irritable bowel syndrome (IBS), gastritis = disappeared.
- Asthma = greatly improved. She breathes with more ease.

**Nutrition/Diet and Exercise :**

- Weight trains and HIIT practitioners = perform movements that were once impossible without pain.

**Employment :**

- Runs a construction business with her husband. She does the books and manages the project. She does not dislike it, but this is not where her heart resides. Additionally, she feels unsettled with her husband's approach because he is illiterate about business but good with sales, which causes friction.
- She is working towards her nutrition and personal training business.
- She set boundaries with a proposition of leaving the business behind if he does not gain some self-control with expenditures regarding their business with her husband.

**Relationships/Social Network :**

- CS3 is unhappily married. She sees him as her best friend, but their marriage has no romantic aspect.
- She decided and had a two-week trial separation, leading to set boundaries and stipulations that he find some professional assistance with his issues, or she will leave because this is toxic for her health.
- CS3 would like a divorce = she is willing to allow him to get assistance before making such a decision.
- She naturally gravitates to breathwork and meditation when negative thoughts or feelings arise. She notices them and chooses to breathe and ground.

- CS3 has no other social circles as her husband becomes jealous, causing arguments. Even if she has female friends, "he gets jealous and asks me if I'm turning lesbian, and why we can't just have the same friends only." =Set boundaries: entitled to her freedom to be out with whom she chooses, learned to be more assertive about her rights and has a sense of self-worth.

- She cannot join networking or social classes because he fears her leaving him = Joined some social and sporting groups and goes out weekly to places she enjoys, trying to find like-minded people.

- She had a long discussion with her mother regarding her past and her mother's actions. Finally, she forgave her and stated that she could not be a part of her life if she were unwilling to seek professional help and admit her mistakes. Her mother agreed, and they have healthy calls weekly = they both had a healthy cry.

- CS3's husband admitted needing some help and will start some sessions soon

- She noticed that she no longer needed or wanted to fight and argue. She no longer feels anger all the time. She calmly walks away.

- She spoke of an event towards the end of the sessions that was quite triggering for her:

- "We had a court case because of business issues and finances, and I noticed something really weird. I saw myself get initially angry, and then another part of me that was watching said, let's just breathe. So I did my breathwork in the courthouse and was fully aware of what was happening around me but completely dissociated from the anger and frustrations. I just told myself that it would all work out for the best and to accept that this is where we are now. I could sense the blood pumping and my heartbeat, and I kept calming it down. Super weird, but then I knew all this stuff we were doing was really working, and even on the ride home, my husband was fuming, but I was calm, and he noticed and told me that I've really changed."

CS3 learned how her childhood trauma, surrounded by drugs, unknown men who abused her, and complete neglect by her mother and absent father, led to her untrusting demeanour, her need for controlling situations and becoming an overly analytical planner anticipating the worst-case scenarios. CS3 also understood that her anger was a mask for buried grief. Moreover, CS3 learned about the mind-body connection, how negative mental states result in negative biochemicals of emotions causing various diseases and health issues, and that nutrition and physical activity alone do not suffice in health.

## Case Study 4 :

**44-year-old Hungarian-Canadian male.**

**Divorced:** two children: a boy, 16 and a girl, 12

**Height:** 6'2"

**Weight:** 245 pounds (overweight)

**Education:** Power Engineering Diploma

**Employment:** Mechanical Manager at the airport

**Religion/Spirituality:** Atheist

**Total face-to-face sessions:** 7 sessions

**Total hours of face-to-face sessions:** 25 hours

**Total texts time over roughly 3 months:** 4 hours

**Pharmaceutical medications, dosage and frequency:**

**Advil:** two to three times per week for pain.

**Non-pharmaceutical medications, dosages and frequency :**

**Marijuana:** eatables two to three times per week for sleep and pain.

**Supplements :** None

**Initial blood pressure :** 113/78 @ 67 BPM baseline.

**Perceived Stress Scale (PSS) :** 5 by his account, the researcher concurs.

**Smoking:** No, never.

**Psychological :**

- Stressed and anxious about money and finances and feels lonely and undeserving of abundance.

**Psychological :**

- Chronic lower back pain and left shoulder pain from past surgeries.

**Nutrition/Diet and Exercise :**

- He consumed fast food roughly twice weekly and ate a diet full of red meat, simple carbohydrates, and starches, with minimal vegetables and fruits. He disliked vegetables.

- He typically plays hockey two to three times weekly in the winter months.

**Employment :**

- He is content with his work but ultimately wishes to work for himself through stocks, woodworking and growing plants. He finds the people he works with relatively pleasant and has made a couple of close friendships there.

**Relationships/Social Network :**

- He is searching for a life partner and a new marriage. He met someone he loves, but she is unavailable. Moreover, he feels lonely and needs a full-time partner. He believes you should find someone to grow old with so you are not alone.
- Social network consists of two or three close friends with whom he can truly be himself. He exhibits many feminine characteristics and thus masks himself around other men to feel less ostracised. His friends are primarily female.

**Results Post Session :****Pharmaceutical medications, dosage and frequency :**

- **Advil:** two to three times per week for pain = zero

**Non-pharmaceutical medications, dosages and frequency :**

- **Marijuana:** eatables and vaping two to three times per week for sleep and pain.
- Reduction from daily - 2/7 per week = 71% reduction

**Initial blood pressure :**

- 101/70 @ 61 BPM baseline.

**Perceived Stress Scale (PSS) :**

- 2 by his account; the researcher concurs.

**Psychological:**

- Stressed and anxious about money and finances = vanished
- CS4 successfully makes money from his stock trades.
- He no longer feels lonely but content.
- He feels more self-confident and happy and can maintain longer joyful states.

**Physiological:**

- Chronic lower back pain and left shoulder pain from past surgeries almost daily.
- Pain is substantially reduced from daily to once every week – 1/7 = 86% reduction in pain occurrences.
- Bloating and flatulence = vanished.

**Nutrition/Diet and Exercise :**

- He consumes fast food once every month. He enjoys vegetables, fruits, legumes, nuts, and seeds and weighs 196 pounds.  $245 - 221.6 = 23.4$  pounds lost.
- He typically plays hockey two to three times weekly in the winter months. In addition, he has added weight training five times per week, and half-hour walks two to three times per week.

**Employment :**

- He received a raise and felt content, knowing he would eventually leave and follow his passion.

**Relationships/Social Network :**

- He is searching for a life partner and a new marriage. He met someone he loves, but she is unavailable. Moreover, he feels lonely and needs a full-time partner. He believes you should find someone to grow old with so you are not alone.
- He has met a lovely woman, and the future seems promising.
- Social network consists of two or three close friends with whom he can truly be himself. He exhibits many feminine characteristics and thus masks himself around other men to feel less ostracised. His friends are primarily female.
- He realises that he is comfortable being who he is and being authentic. However, he understands that the social conditioning of Western males is associated with several diseases, like heart disease, and he does not wish to be like his father.

- He has a better relationship with his parents. He no longer holds resentment or anger towards them. Instead, he sees them bi-weekly for dinners.

CS4 learned how his father's demeanour and beliefs regarding money were subconsciously installed in his childhood, resulting in him feeling inadequate and unworthy of having a life of abundance and creating a subconscious self-sabotage cycle. Moreover, CS4 learned about the mind-body connection and how negative mental states result in negative biochemicals of emotions, causing various diseases and health issues.

**Case Study 5 :****18-year-old German-Egyptian-Canadian female.**

**Boy Friend:** No Children.

**Height:** 5'4"

**Weight:** 108 pounds

**Education:** Psychology Student

**Self-employed:** Part-Time Retail Associate

**Religion/Spirituality:** Spiritual

**Total face-to-face sessions:** 8 sessions

**Total hours of face-to-face sessions:** 8 hours

**Total texts/emails time over roughly 3 months:** 7 hours

**Pharmaceutical medications, dosage and frequency:**

**Tylenol:** twice per month for period cramps and pain.

**Ibuprofen:** twice per month for period cramps and pain.

**Non-pharmaceutical medications, dosages and frequency :**

**Marijuana:** eatables and smoking three to five times daily for sleep and relaxation.

**Supplements :** None

**Initial blood pressure :** 85/56 @ 88 BPM baseline (Hypotensive). She gets dizzy and lightheaded when moving. She sometimes faints.

**Perceived Stress Scale (PSS) :** 7 by her account, the researcher concurs.

**Smoking:** No, never.

**Psychological :**

- TV/Phone addiction, eating disorder, chronic fatigue, sleep disruptions, insomnia, low self-confidence and self-esteem, procrastination, depression, fear, memory issues and anxiety.

**Physiological :**

- Irritable Bowel Syndrome (IBS), Acne, Eczema and Raynaud's.
- She has recently started to react to strawberries allergically.
- She gets colds and illnesses quickly and often.

**Nutrition/Diet and Exercise :**

- CS5 does not eat well or often. She suffers from low-grade dysmorphia and anorexia.
- CS5 does not exercise because she feels too exhausted.

**Employment :**

- CS5 enjoys her part-time retail position. She likes to interact with people and has a good fashion sense. However, she is excited about becoming a psychologist because she genuinely wants to help others heal and not feel as she does.

**Relationships/Social Network :**

- CS5 has a wonderful relationship with her mother. They are best friends, and she feels safe and comfortable sharing everything with her.
- CS5 does not have any contact with her biological father.
- CS5 loves her stepfather, whom she regards as her biological father.
- CS5 has a good relationship with her grandparents from her mother's side.
- CS5 has loved her boyfriend for about five years; however, they have many arguments several times a week.
- CS5 has a best friend since childhood, but she is "a bit scattered and has a lot of issues." She has other friends but has cut ties with most of them "because they were toxic."

**Results Post Session :**

**Pharmaceutical medications, dosage and frequency :**

- **Tylenol:** twice per month for period cramps and pain = zero
- **Ibuprofen:** twice per month for period cramps and pain = zero

**Non-pharmaceutical medications, dosages and frequency :**

- **Marijuana:** eatables nightly and smoking three to five times daily for sleep and relaxation = Down to smoking twice daily and eatables every two to three weeks.

**Initial blood pressure :**

- 100/70 @ 84 BPM baseline (no more hypotensive). She no longer gets dizzy and lightheaded when moving or faints.

**Perceived Stress Scale (PSS) :**

- 3 by her account, and the researcher concurs.

**Psychological:**

- Chronic fatigue, memory issues, insomnia and sleep disruptions = vanished.

- She is still a bit addicted to her phone and TV but puts them away to meditate roughly five to six times daily for about ten minutes each.

- Eating disorders and body dysmorphia are under control - 108 pounds = 118 pounds (gained 10 pounds).

- She enjoys making shakes the most and having smaller snacks instead of meals.

- She exhibits higher self-confidence and self-esteem and less procrastination. "I feel like I can do whatever I want when I actually put my mind on it and relax and not overthink it all. I love meditating and breathing when I feel off; it helps me feel so much better."

- Depression, anxiety and fear = absent.

#### Psychological:

- Irritable Bowel Syndrome (IBS), Acne, Eczema, and Raynaud's = vanished. She noticed the link between negative mental states and stress in all three activities.

- Strawberries allergically = vanished.

- She gets colds and illnesses easily and often = She needs to work on her immune system's strength, requiring more patience and commitment to eating well and managing her mind.

#### Nutrition/Diet and Exercise :

- Low-grade dysmorphia and anorexia = Eats small snacks and loves her shakes and smoothies—gained 10 pounds - feels more comfortable in her body.

- CS5 does not exercise because she feels too exhausted = Weight trains two to three times per week, walks and does some yoga a couple of times per week.

#### Relationships/Social Network :

- CS5 has no contact with her biological father but forgives him despite the hurt.

- CS5 has a good relationship with her maternal grandparents and has learned to set boundaries to avoid guilt.

- CS5 has loved her boyfriend for about five years; however, they have many arguments several times a week = Set boundaries and arguing less frequently, and he is seeking therapy.

CS5 learned how her father's abandonment and her mother's justified absenteeism resulted in her need to control situations and focus on the worst-case scenarios. Moreover, CS5 learned about the mind-body connection and how negative mental states result in negative biochemicals of emotions, causing various diseases and health issues.

#### Case Study 6 :

**18-year-old Asian male.**

**Girl Friend:** No Children.

**Height:** 5'6"

**Weight:** 125 pounds

**Education:** Nursing Student

**Self-employed:** Part-Time Server

**Religion/Spirituality:** Christian (very religious)

**Total face-to-face sessions:** 8 sessions

**Total hours of face-to-face sessions:** 25 hours

**Total texts/emails time over roughly 3 months:** 4 hours

**Pharmaceutical medications, dosage and frequency :** None

**Non-pharmaceutical medications, dosages and frequency :** None

**Supplements :** None

**Initial blood pressure :** 100/79 @ 94 BPM baseline.

**Perceived Stress Scale (PSS) 7 by his account,** the researcher concurs.

**Smoking:** No, never.

#### Psychological:

- Paranoia, stress, anxiety, depression, guilt, racing thoughts, panic attacks, control issues, procrastination, chronic fatigue, low self-confidence, and self-sabotage.

- Addiction to Phone/TV and Porn.

#### Psychological:

- Weak immune system and gets ill often.

- Remission from Acute Myeloid Leukaemia.

- High ferritin levels.

- Possible acute kidney disease.

#### Nutrition/Diet and Exercise:

- CS6 eats a diet rich in fermented foods, red meats, and starchy foods, with little to no vegetables and fruits.

- CS6 does not exercise because he feels too fatigued.

#### Employment

- CS6 enjoys his part-time serving position, working at his parent's Chinese restaurant while attending nursing school.

However, he is excited about becoming a nurse because he wants to help others feel safe and comforted in hospitals.

### **Relationships/Social Network**

- CS6 does not have a close relationship with his parents.
- CS6 loves his girlfriend and has been together for about five years; however, they have many arguments several times a week.
- CS6 has friends through his church associations and bible camps.

### **Results Post Session :**

#### **Initial blood pressure :**

- 123/77 @ 63 BPM baseline.

#### **Perceived Stress Scale (PSS) :**

- 2 by his account, and the researcher concurs.

#### **Psychological :**

- Paranoia regarding his relationship is minimised. He does breathwork and meditation when it arises, finds they subside, and can think clearly.
- Stress, anxiety, depression, guilt, racing thoughts, panic attacks and control issues = VANISHED. He feels more in control of his mind and directs his attention toward his future nursing goals and healthy relationships, thus no longer self-sabotaging or procrastinating.
- CS6 feels more energised and can exercise again.
- He feels less guilt regarding his parents and siblings, sets healthy boundaries for himself, and understands that caring and help do not come at the cost of your health and goals. Moreover, he no longer feels God is punishing him but feels loved and safe. He understands that his reaction toward his girlfriend was because he could not be vulnerable or fully trusted due to a lack of exposure to this as a child. He also realised that he was acting comparatively to his mother's treatment. His self-confidence levels are high.
- CS6 no longer desires to watch pornography and understands that he was using it to feel something pleasant because he did not have much love or support as a child.
- Less engaged in TV/Phone. Monitored his time and reduced it to one to two hours a day. He prefers to study instead.

#### **Physiological:**

- Week immune system and gets ill often = too early to assess changes

- Remission from Acute Myeloid Leukaemia = still in remission.

- High ferritin levels = normal (according to blood serum results).

- Possible acute kidney disease = getting tested/unknown.

### **Nutrition/Diet and Exercise:**

- CS6 eats more vegetables, fruits, legumes, and complex carbohydrates and minimises red meats and processed foods.
- CS6 practices WuShu and goes for daily walks.

### **Relationships/Social Network**

- CS6 has a closer relationship with his parents after a candid discussion regarding his overall well-being and setting boundaries.
- CS6 loves his girlfriend and argues much less. "She tells me to go to my breathing when I start to get unsettled, and I do. She is doing them too. We can talk calmly now."

CS6 learned how his childhood trauma of his mother's conditional love style and emotional neglect led to his untrusting demeanour and his need to control situations, and he was becoming an overly analytical planner anticipating the worst-case scenarios in life. CS6 also recognised how his romantic approach mimicked his mother's approach to him. Additionally, CS6 understood that his anger was a mask for buried sadness. Furthermore, CS6 acknowledges that God does not conditionally love because God is pure love, and placing conditions is a human construct. Moreover, CS6 learned about the mind-body connection and how negative mental states result in negative biochemicals of emotions, causing various diseases and health issues.

### **Case Study 7 :**

#### **54-year-old Anglo-Saxon female.**

**Single: Two Sons: 19 and 21 years old.**

**Height:** 5'4"

**Weight:** 187 pounds (overweight)

**Education:** High School Diploma

**Self-employed:** Tarot Reader, Reiki practitioner and Light Worker

**Religion/Spirituality:** Believes in God

**Total face-to-face sessions:** 12 sessions

**Total hours of face-to-face sessions:** 38 hours

**Total texts/emails time over roughly 3 months:** 12 hours

**Pharmaceutical medications, dosage and frequency :**

- **Cymbalta:** 30mg/day
- **Salbutamol:** 100mcg @ 2x/day
- **Tylenol 3 (Codeine):** 2x/week
- **Cyclobenzaprine:** 10mg 2x/week
- **Tylenol and Advil Extra Strength:** 3x/week.

**Non-pharmaceutical medications, dosages and frequency :**

- **Marjuana:** eatables and vaping 3x/week.

**Supplements :**

CMullein, evening primrose oil, multivitamin

**Initial blood pressure :** 169/108 @ 91 BPM baseline (Stage 2 hypertensive).

**Perceived Stress Scale (PSS)**

C7 by her account, the researcher concurs.

**Smoking:** Yes: 1982-1994 then 2010 to current.

**Psychological:**

- Stress, anxiety, depression, PTSD, procrastination, chronic fatigue, low self-esteem, self-sabotage, and memory issues.
- Addiction to Phones/TV, shopping and smoking cigarettes (about a pack per day).

**Physiological:**

- Chronic pain, Menopause, Asthma.
- Osteoarthritis, anaemia, collageneous colitis/IBS, arthritis, Ehlers-Danlos syndrome and allergies.

**Nutrition/Diet and Exercise:**

- CS7 barely eats during the day and relies on smoking and coffee instead of food.
- CS7 does not exercise because she feels too exhausted, has no motivation, and feels restrained by her pain.

**Employment :**

- CS7 enjoys working as a Tarot card reader and Reiki practitioner.
- CS7 works part-time at a crystal store.

**Relationships/Social Network :**

- CS7 does not have a close relationship with her parents.
- CS7 has a large social network but only one close friend.
- CS7 does not have a close relationship with her sister.

**Results Post Session :**

**Weight:** 172 pounds = 15 pound drop

**Pharmaceutical medications, dosage and frequency**

- **Cymbalta:** 30mg/day = zero
- **Salbutamol:** 100mcg @ 2x/day = zero
- **Tylenol 3 (Codeine):** 2x/week = zero
- **Cyclobenzaprine:** 10mg 2x/week = zero
- **Tylenol and Advil Extra Strenght:** 3x/week = zero

**Non-pharmaceutical medications, dosages and frequency :**

- **Marijuana:** eatables and vaping 3x/week = zero

**Initial blood pressure :** 105/79 @ 72 BPM (no hypertension)

**Perceived Stress Scale (PSS) :**

- 3 by her account, and the researcher concurs.

**Smoking :** Yes: 1982-1994, then 2010 to current at a pack a day = quit smoking

**Psychological:**

- Stress, anxiety, depression, PTSD, procrastination, chronic fatigue, low self-esteem, self-sabotage, and memory issues = vanished.
- Addiction to Phones/TV, shopping and smoking cigarettes (about a pack per day) = vanished

**Psychological:**

- Chronic pain, Menopause = vanished.
- IBS, arthritis, Ehlers-Danlos Syndrome, anaemia, asthma, and allergies = vanished.
- However, osteoarthritis and collageneous colitis require additional tests to verify their status.

**Nutrition/Diet and Exercise:**

- CS7 barely eats during the day and relies on smoking and coffee instead of food = Eating every two hours, only having one cup of coffee early in the morning and stopping smoking.

• CS7 does not exercise because she feels too exhausted, has no motivation, and feels restrained by her pain = She does daily Yoga and walks.

#### **Relationships/Social Network :**

- CS7 does not have a close relationship with her parent = she still does not, but she better understands them and forgives them for the past.
- CS7 does not have a close relationship with her sister = she still does not, but she better understands her and is working on acceptance.
- CS7 does not have a close relationship with her sister = she still does not, but she better understands her and is working on acceptance.

CS7 learned how her mother's conditional love and eating patterns led to her feeling unworthy of abundance, unconditional love and acceptance and anticipating the worst-case scenarios. CS7 also acknowledged that her smoking was initially to imitate her mother in hopes of gaining acceptance and then became a coping mechanism to bury hurt and pain instead of confronting it. Moreover, CS7 learned about the mind-body connection and how negative mental states result in negative biochemicals of emotions, causing various diseases and health issues.

### **Case Study 8 :**

#### **38-year-old Romanian Female**

**Married:** 2 girls aged 9 and 14

**Height:** 5'5"

**Weight:** 116.8 pounds

**Education:** Bachelor's Degree

**Employment:** Leader Development Manager, and she provides fundraising for the less fortunate.

**Religion/Spirituality:** Christianity

**Total face-to-face sessions:** 6 sessions

**Total hours of face-to-face sessions:** 15 hours

**Total texts/emails time over roughly 3 months :** 2 hours

**Pharmaceutical medications, dosage and frequency:** None

**Non-pharmaceutical medications, dosages and frequency :** None

**Supplements :** Essential Oils: Lime, Lemon, plus Multigreens in shakes and smoothies

**Initial blood pressure :** 109/79 @ 84 BPM baseline.

**Perceived Stress Scale (PSS) ;** • 4 by her account, the researcher concurs.

**Smoking ;** Smoked a pack per week for seven years but quit in 2019.

#### **Psychological:**

- Self-confidence, procrastination, perfectionism.

#### **Psychological:**

- Chronic fatigue, Dermatographia, Raynaud's, Chronic Migranes.

#### **Nutrition, Diet, Exercise:**

- Her diet is clean, primarily pesticide-free, non-GMO vegetables and fruits, and wild seafood, poultry and lean meats occasionally.
- She rarely eats fast food and dislikes processed and junk foods.
- She used to enjoy walks but has not in several years.

#### **Employment :**

- She loves her work. She finds peace and joy in using essential oils for natural healing and enjoys the company of her coworkers.

#### **Relationships/Social Network :**

- Happily married.
- She loves her kids dearly and spends a great deal of time with them.
- Social networks consist of supportive, like-minded people who uplift and bring joy.
- Close relationship with her parents and brother.

### **Results Post Session :**

**Initial versus current blood pressure :** 104/79 @ 84 BPM and still within a normal healthy range.

#### **Perceived Stress Scale (PSS) :**

- 0 by her account, the researcher concurs.

#### **Psychological :**

- Self-confidence, perfectionism, and procrastination = vanished

#### **Psychological :**

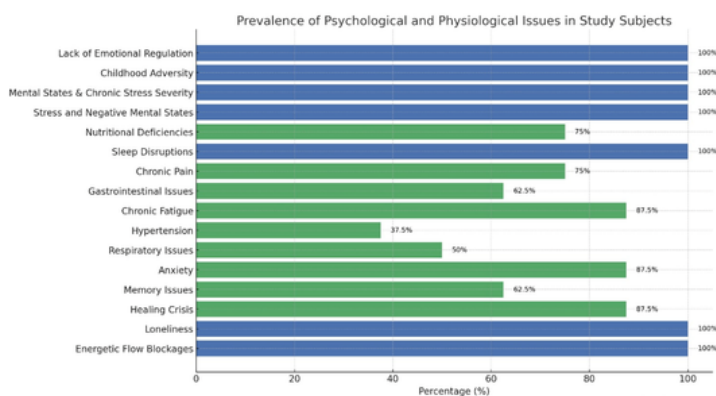

- Raynaud's, chronic migraines, Dematographia, and Chronic Fatigue = vanished.

## Exercise :

- She walks daily for about 45 minutes and hikes with her family on weekends.

CS8 learned that perfectionism does not exist and leads to stress in the mind and body. CS8 also understood that she exhibited such traits due to trying to impress her mother as a child. Moreover, CS8 learned about the mind-body connection and how negative mental states result in negative biochemicals of emotions causing various diseases and health issues and that nutrition and physical activity alone do not suffice in health. CS8 stated she started to "hear wolves" in her meditations and felt like she was leaving her body. Moreover, she feels peaceful and full of love, believing that "God is with me." Additionally, she has managed to manifest the position she was after in her company and a retreat which initially scared her, "I believed what you were telling me about the energy we give off and how that makes our life and that I can get what I want by controlling my mind, but to have it happen in a couple of weeks is just crazy. It's a bit scary that everything I wanted is here, but I am grateful too."

## Comparative Discussion :

Each participant's beliefs, thoughts and feelings are assessed, and negativity is reframed towards positivity by knowing why their perceptions are the way they are. Knowledge through learning is the precursor to understanding and change. Moreover, the subjective reflection of each participant should never be dismissed nor undermined because "reported improvement is one of the best ways to determine whether any assessment technique is effective" (51).

### Several themes exist among the participants:

1. All subjects (100%): There is a persistent lack of emotional regulation due to an absence of internal understanding of their subconscious minds (beliefs, thoughts, emotions, and behaviours).

2. All subjects (100%): They faced adversity ranging from light to extreme in their childhoods and always with immediate parental associations, which may explain why they exhibited several psychological issues and physiological diseases.

3. All subjects (100%): The degree of adversity is reflected in the severity of the negative mental states, chronic stress, and various physiological diseases.

4. All subjects (100%) exhibited stress ranging from mild to severe, and all held some form of negative mental state.

5. Six out of the eight subjects (75%) suffered from nutritional deficiencies primarily due to a lack of fruit and vegetable consumption in their diets, leading to mental, emotional and physiological system imbalances and malfunctions at the cellular level and magnified by negative mental states and chronic stress.

6. All subjects (100%) suffered from sleep disruptions or felt tired regardless of sleep duration, augmented by negative mental states and chronic stress, creating a cyclical concern, which was eliminated after reframing negativity and supplementing lifestyle changes.

7. Six out of eight (75%) subjects exhibited chronic pain exasperated by negative mental states and chronic stress and reduced or eliminated after reframing negativity and supplementing lifestyle changes.

8. Five out of eight (62.5%) showed gastrointestinal issues related to negative mental states and chronic stress, reduced or eliminated by reframing negativity and supplementing lifestyle changes.

9. Seven out of eight (87.5%) subjects demonstrated chronic fatigue associated with negative mental states and chronic stress, which was reduced or eliminated by reframing negativity and supplementing lifestyle changes.

10. Four out of eight (50%) subjects revealed respiratory issues, which may be attributed to negative mental states and chronic stress amplified by smoking and vaping, eased by reframing negativity and supplementing lifestyle changes.

11. Seven out of eight (87.5%) subjects had anxiety directly tied to negative mental states and chronic stress, which was removed by reframing negativity and supplementing lifestyle changes.

12. Five out of eight (62.5%) subjects had memory issues connected to negative mental states and chronic stress, eliminated by reframing negativity and supplementing lifestyle changes.

**13.** Five out of eight (62.5%) subjects had memory issues connected to negative mental states and chronic stress, eliminated by reframing negativity and supplementing lifestyle changes.

**14.** Seven out of eight (87.5%) subjects exhibited the 'healing crisis' (51), with the severity of mental, emotional and physiological issues increasing (observed in their EEG and HRV) due to being upheaved from the subconscious due to being previously suppressed and repressed, and followed by detoxification and realignment in bodily systems and functions. Each individual's length of the healing crisis varied and eventually subsided to health and stability.

**15.** All eight (100%) subjects exhibited loneliness associated with a lack of authenticity rather than a lack of a social network.

**16.** It may be reasonably deduced that all eight (100%) subjects had various blockages in energetic flow in mind and body owing to distorted beliefs, thinking and emotions.

An indispensable discernment is that loneliness does not come from a lack of people but from being unable to communicate authentically and openly what a person deems meaningful to them and holding certain beliefs that others may find objectionable (52). Authenticity is the congruence between believing (programming), thinking, feelings, and acting or behaving in unison, which many rarely comply with, fearing others' actions and thoughts towards them, and chiefly subject to sociocultural and traditional ideologies, which are not facts within themselves, but often taken as such. Although the sample size is small, there is sufficient evidence linking negative mental states to chronic stress leading to disease, demonstrating the cyclical nature of mind and body connections and how negative mental states propagate chronic stress leading to the dysregulation of bodily functions. By consistently rewiring the current neural synaptic connections through psychoanalytical introspection, meditative practices and biofeedback sessions, we alter the pathways of negativity to positivity, thereby fundamentally changing the hedonistic adaptation baseline and the DMN autopilot in the brain. When we quit selfing and abandon the incorrect assumptions of the subject-object split through a form of dissociation, we become ever-present and conscious to witness the thoughts and feelings instead of becoming engrossed and consumed within the rumination cycles. Such objective dissociation is required to unlock the subconscious mind housing our programs and has the advantage of questioning the underlying beliefs driving thought patterns, emotional biochemicals, behaviours and actions, consequently changing the cycle to better our health and healing. Such practices induce a physical change in the body and the brain because it is a physical constituent of the body through the power of the mind.

## General Information :

A patient's average allopathic visit is seven to eight minutes (53), leaving little time to understand and evaluate their uniqueness and life patterns holistically and adequately. The average time per session with a psychiatrist or therapist in Canada is 50 minutes (54). Normal blood pressure has been redefined numerous times over the past several decades and is a highly fluctuating physiological function; therefore, it is difficult to specify, but some arbitrary limits have been established (53). A general rule is that 120/80 or less is healthy, over 120-80 is elevated, over 130-89 is stage 1 hypertensive, over 140/90 is stage 2 hypertensive, and over 180/120 is a hypertensive crisis (55; 56). However, under 90/60 is considered hypotensive (57; 56).

## Further Research & Conclusion :

- Larger participant numbers would add more supplemental data for negative mental states leading to chronic stress. The same approach is required to tie chronic stress manifesting in disease.
- To assess epigenetic alterations, conducting salivary epigenetic expression testing before and after the trials would aid in epigenetic connections.
- Performing microbiome testing to assess the changes in the microbiota prior to the initial trial and marking changes would benefit the gut/brain axis research.
- Conducting fMRI and SPECT scans before and after sessions could reveal functional brain changes.
- Conducting salivary sIgA swabs could assess immune system variations.
- Conducting blood serum tests for cortisol and adrenaline could assess altered levels.
- A wider racial and cultural demographic is needed to derive a generalised global conclusion.
- A six-month and one-year follow-up is recommended to observe long-term changes.

This paper's primary study and research hypothesis was that most chronic diseases are psychosomatic, driven by persistent negative mental states leading to chronic stress and manifesting into psychological and physiological diseases. Therefore, chronic stress often causes chronic disease. A paradigm shift to a holistic worldview is essential to resolve current-day affairs. Most issues today cannot be understood in isolation because they are systemic, interconnected and interdependent, necessitating a perception and perspective change. By understanding subconscious beliefs, we can unlock historical patterns, thus altering our perception of stressful stimuli, consequently changing our relationship and associations with those stimuli and inducing a relaxation response (53). What we believe, we become, for better or for worse.
