Abstract :

The Article mainly describes the importance of resources in the economy and argues that profit is not necessary for a healthy economy. It emphasizes the need for a stable economy for a stable society and proposes the concept of a circular economy. The author suggests that global sustainable peace requires eradicating poverty and mutual control of armed forces. The "One World, One Nation, One Love" organization is presented as a solution to current global crises, with pillars such as a universal basic income and a new currency. The text also mentions the need to eradicate exploitation and proposes a new currency based on resources and public worked hours. The transition to the new currency and implementation of the universal basic income may require erasing some debts.

Keywords : Healthy economy, Poverty

Introduction :

The “One World, One Nation, One Love” relies on the following pillars: a 50/50 mode, with a universal basic income, a new currency and the delocalization of political personnel and of armed forces, which we are about to describe. It is understandable that such a radically different model might be qualified of utopia which unofficial critics actually already did, however we will easily prove this counter argument wrong. Despite the unusual aspect the implementation and the feasibility are realistic.

50/50:

This is the working model in which 50% of the time are worked for the community and 50% worked for oneself. The 50% worked for the “community” consist essentially in environmental tasks in order to “heal” the environment and eventually to rebuild the stock of natural resources, the ultimate goal being the establishment of a circular economy. Indeed, in a circular economy the need for resources should reduce as well as the related conflicts. I The three main reasons leading to the 50/50 suggestion are #1 the need to get out of the traditional antagonism capitalism/communism, #2 the need for all participants to meet in person, #3 the need to stop exploitation which is a real “pain in the ass” of any society, preventing societal evolution and always the source of instability and violence especially in times of crisis.

A comment about aspect #1: The debate between capitalism and communism is an endless debate without definitive answer. Endless debates always entail the corresponding social conflict which is destabilizing society and preventing any possible form of societal evolution. Capitalism is the economic version of selfishness and communism is the economic version of altruism. The truth is that for our survival as a species and as individuals we need both.

we need a certain amount of selfishness and a certain amount of altruism. Thus the best solution was to arbitrarily close the debate with a 50/50 solution. When we actually don't know which one is best, then rationally the optimal solution is a 50/50 option. Then time and experience will tell in which cases we should adjust this percentage to a 30/70 or 70/30 for instance.

A comment about aspect #2: The necessity for all actors to meet personally. In our current society the specialization of tasks has led to increase not only the gap between our elites and the people but also the gap between jobs which reinforces misunderstandings between the different economic actors of our urban societies. Let us take the example of passengers waiting for the train. Most of the time passengers blame the transport society for the delay of the train. But train drivers blame the passengers because they are the ones actually delaying the trains because of their lack or organization. How often do we see passengers who try to catch the train after the alarm rang delaying the closure of the doors? An essential purpose of the 50% worked for the community is to bring all participants to work together which should contribute to the fall of many preconceived ideas and increase mutual understanding. Re-building the social link necessary to a stable society.

A comment about aspect #3: The 50% worked for the community should help eradicating exploitation while insuring that the low qualified depressing dangerous boring and necessary tasks aka "dirty jobs" are fulfilled by all citizens. We work for the community instead of paying taxes that would be used by the administration to pay for services and have these necessary tasks fulfilled. Exploitation is when always the same actors are assigned -by force and/or by the system- to the low paid "dirty jobs" which is obviously a source of discontent of lower social classes, especially in crisis times. The existence of a social hierarchy is for most individuals acceptable and understandable. Problems arise when the very livelihood and existence of lower social classes are endangered by poverty. In such circumstances exploitation is felt as a real injustice and becomes a source of social instability. When absolutely all citizens participate to these "dirty tasks", then as a consequence absolutely all citizens are "exploited" for the benefit of all citizens and not for the benefit of the "government" or of the "capitalist elite". Then there are no more reasons to envy or discriminate other social classes. During the other 50% worked for oneself, some might want to rest or enjoy life, others might want to generate a supplementary income, as they please. The most objective and fair compromise possible.

Concretely, we could imagine each world citizen would go to a local agency where we would be allocated a task to fulfil for the community. The implementation is obviously realistic and perfectly feasible, hence this is no utopian solution. We even already have similar structures with employment agencies.

A New currency:

In order to reduce eradicate poverty -and eventually reduce inequalities- while somehow counterbalancing the power of our current financial leadership we might need a new currency which value is based on the global amount of resources available worldwide and eventually on the number of public worked hours aka the 50% worked for the community. Such a currency should enable a better control of inflation since the creation and injection of supplementary amounts of this currency would depend on the actual amount of available resources. It is a similar system to the gold exchange standard with the difference that this currency is paired with a much wider range of resources [1]. The possibility to change the old currencies into the new one will be conditioned to the project. The basic principle is the following: only if the project aims at increasing the stock of resources will it be possible to change some of the old currency into the new one. The two main purposes of this measure are:

#1: restrict the power of current capitalist financial forces with respect to these ladies and gentlemen, but it is a necessary measure- Indeed logically considered the impossibility to change from the old currency to the new one will enable a new start with equal chances for all actors. The current fortunes will "start from scratch" in the new currency, like all other citizens… In other words, their "monetary wealth and power" will not be effective any more. However, the possession of their physical assets remains untouched. We wish they will not use their physical assets to keep controlling the economic system. Should this be the case, the world citizens always have the possibility to decide rules to counterbalance or prevent such actions… The more citizens support this suggestion, the easier its implementation. Besides with the possibility to invest in projects that enable the recycling or retrieval of wasted resources, the ability to earn a supplementary income remains. Besides even if we anticipate the understandable possible objection of the wealthiest, it is important to remind them and our readers that they did not become rich only thanks to their hard work. They became rich because our biased system enabled that to happen [2].

The greatest part of their wealth is the result of luck. The second main purpose of this document is to demonstrate that our current capitalism based system is flawed and disadvantages most world citizens, which is not only unfair but also non constructive. The difference in earnings between the top CEOs and the lower average workers are clearly not only explainable because of the amount of work. This is obviously due to a random aspect, a luck factor and/or the biases and flaws of the current system.

#2: correlating the currency to the creation of wealth and of resources in order to avoid financial crises. Consequently, the amount of money increases only with the amount of resources. This should prevent the formation of a financial bubble and stabilize the economy. Besides the more we recycle and/or retrieve wasted resources from the environment, the more we can create money and wealth. Until we manage to establish a circular economy. The establishment of a circular economy being a necessity for the long term survival of a civilization. The closer we come to 100% circular the higher the chances of survival of the species. This is a law of physics.

Some voices also seem to fear the implementation of a global digital currency controlled by an "ominous central global government". Even if this option is actually possible, we would like to remind our readers that world citizens also have the possibility to create their own digital currency. This was most likely the original purpose of the Bitcoin. But for this currency not to become an object of speculation and hence escape the control of the people, we need the appropriate system [3]. As long as we cannot pay universally in Bitcoins or any other independent digital currency and have to change these currencies into dollars or euros for instance, then the current banking system has the control over all possible currencies we can create. The sole system, that guarantees citizens the control over the economy and the currency is the "One World, One Nation, One Love". In 2001 Europe introduced the "euro", a new currency replacing all previous European currencies, which once again shows, that we already have the relevant experience. Hence this suggestion is also no utopian solution.

Erasing of all debts:

For individuals, companies as well as nations. In order to facilitate the transition to the new currency as well as the implementation of the UBI and eradicate poverty for more social stability, we might need to erase some debts if not all. The text "The UBI and the Eradication of Poverty" later in this chapter gives more details on the benefits and reasons why such a measure might not be useless. Technically considered the new currency + the erasing of all debts constitute a reset of the economy. We heard many times the conspiracy theorists fearing the "great reset" that they suspect some financial elite want to impose to the world. Should the idea of a "great reset" have been stolen from the artist, then we now know how the knowledge of the artist was twisted. In any case the "reset" meant by the artist is definitely a counter-measure to the current power of the global financial powers. It is meant in the interest of the people. This measure is also no utopia. Indeed, this has been done many times for different third world countries, who were obviously not able to pay back their debt. Besides we might not have the choice. Indeed, currently almost all countries on Earth are indebted. Most of them will most likely never be able to pay back the total amount of their debt including. The 20 most indebted nations on Earth all have more debts than their yearly income [4].

Their debts are higher than 100% of their gross domestic product. Between 10 to 15 of these countries can be considered western industry nations, among which the U.S., Canada, Japan, France, Italy, Spain and Bahrain, among others. It is hardly conceivable that this does not cause an extreme severe crash of the global economy. When this happens, all nations as well as the private actors to whom they owe this money will be forced to admit that there is no other solution than to "readjust" the debts of all nations and start from scratch. Thus we might want to prevent such a crash while taking the risk to implement a system offering more social and economic stability. We might also want to add the following comment. Indeed, as previously mentioned, the current model was unofficially criticized and qualified as being utopian. The author of this document used to agree with this critic [5].

However, the more thorough the thoughts, the deeper the conviction that there are no other options. Some voices are afraid it would not work, which is fair since it was never tried before. However, the current situation unavoidably leads to the world bankruptcy. We insist: absolutely unavoidably. Nothing that is being done currently can avoid that. At best postpone it, but not avoid it. Realistically considered there is nothing worse than the absolute total bankruptcy of the whole world. Thus our current suggestion cannot be worse than the unavoidable scenario heading to us. With one difference: our suggestion might work. The chances may be slim.

But they are genuinely the sole realistic ones. Thus either we sink while doing nothing -status quo- or we sink trying to change something, which statistically and logically considered is our sole realistic chance to either avoid or at least milden the unavoidable. Fortunately, all measures presented until now are actually implementable and not utopian at all.

Worldwide universal basic income:

Worldwide universal basic income with strict control of prices -especially housing and energy prices- in order to insure purchase power and to help eradicate poverty. The UBI is not only the best way to eradicate poverty, it is also a very useful mean to support individual entrepreneurship via micro financing. Besides it favours "social serendipity" that can inspire many micro projects in which our current financial and banking system would never invest and that could bring substantially more wealth to the global society… More details on this second aspect of the advantages of the UBI later in this chapter… It is a safety net for small entrepreneurs. UBI enables "safe entrepreneurship". This measure is also no utopian at all and was tested locally in different countries. All reports the artist aka the author of this document has been aware of were positive [6].

Market of priorities:

Distribution of resources per capita and not per country/nation any more. Each world citizen becomes owner of a "wallet of resources". This wallet of resources is composed of a percentage of all resources available worldwide. Each citizen is given a percentage of all possible resources. Then each citizen decides with which priority his/her resources should be allocated. This implies the creation of a "market of priorities" where all priorities of all citizens are gathered and rated. Then the production is done according to the "ranking of priorities". Since each citizen becomes the owner of resources that are not necessarily in his/her country this implies the abolition of frontiers, hence the "One World, One Nation, One Love". This wallet of resources is the actual "wealth" possessed by each of us. Obviously the amount of wealth depends on the number of inhabitants and the amount of resources [1]. A ratio This should raise the awareness of citizens to the actual economic reality. The more inhabitants and the more we waste resources, the poorer we all become. Thus in order to earn more. we might be spontaneously incited to control birth rate as well as to spare resources and even recover wasted resources as much as possible. The holy grail of this system being the creation of a circular economy in which 100% of resources are being recycled. A further advantage of this model is that producers know exactly in advance the exact quantities that have to be produced which should help reducing the amount of unsold products and hence reduce the waste of resources. Furthermore, one can notice that the principle of a democratic market economy remains unchanged. The main difference is that on the market of priorities we are not exchanging abstract values but concrete amounts of resources corresponding to the actual needs. It might not be needless to attract once more the attention of our hypothetical readers on the realistic aspect of this measure. Another non utopian possibility that is in use since a couple of millennia at least: the market principle. This market where all economic decisions are made is controlled by all citizens equally and simultaneously.

Delocalization of political personnel:

Delocalization of political personnel for an increased objectivity of arbitration, less influence of lobbies, less corruption and more control over the political leadership. For example, and to simplify we could imagine that Chinese citizens keep the same going system but all candidates as "Lead Executive" aka President are U.S. citizens, whereas the U.S. voting between citizens of India as "Lead Executive". The "lead executives" could also be chosen from smaller countries for more objectivity and less conflicts of interest. We could also move these personnel every 5 or 10 years to other countries just like for diplomatic personnel: to avoid the building of too deep local ties that are the breeding ground of corruption. Indeed, non-local personnel should be able to arbitrate local issues of all kinds more objectively. At this stage of our thinking we might precise that the need of political personnel might be irrelevant. At least the need for standard political personnel. Technically considered politicians are supposed to represent the needs and ideas of their electors. In the suggested model, the market of priorities makes redundant a large part of the tasks fulfilled by politicians. Besides the possibility also exists to create a market for all other ideas and needs including justice and police. At least technically considered, the principle of gathering ideas and needs and satisfy them according to the priorities of citizens is the most democratic system possible [5].

This being said, since it is about the "One World, One Nation, One Love" at a certain point we might want to implement a global collegial consultancy. A college of citizens with acknowledged experience and influence helping other to better understand and take appropriate decisions. Reasonably the could be multiple collegial consultancies: for sciences and A.I., economics, medicine etc. However, this might not be necessary. Useful but not necessary. Indeed, with time such collegial consultancies might become a kind of new elite, which is precisely what we need to avoid... Furthermore, we also need to address the traditional fear of a "global government" that would control everything and install a dictatorship.

We need first to precise that this fear is not necessarily logically argued. In the present case, the collegial "leadership" would not have a decision power since most decisions -at least economic decisions- are taken by the market of priorities, thus by the citizens. Hence in the hypothesis of the need for political personnel at all, then these personnel might be needed essentially to represent ideas rather than to take decisions. Not everyone might be able to have a global analysis of problems and solutions and it can be useful for world citizens to have personnel making them aware of problems and/or suggesting solutions citizens might not be able to find on their own.

Furthermore, the collegial aspect is a supplementary measure to prevent usurpation of power. Power is a drug, the worst drug ever. Should there be one single leader, this could raise the egocentric temptation of many to rule over mankind and this is precisely what we want to avoid. The artist aka the author of this text would even suggest a collegial leadership composed of an uneven number of members which are all selected among smallest countries. Indeed, the smaller countries traditionally have less imperialistic needs or "drive". Thus the leadership of personalities coming from smaller countries might increase the political stability of the global society [2].

Regardless of the change it represents in comparison to our current system, when objectively considering this suggestion -putting our subconscious fears aside- we realize the necessary structures for the implementation of such a measure already exist: diplomatic personnel... Strictly technically considered we only need to increase the amount of "abroad personnel" and extend or amend their functions. This is absolutely no utopian measure since similar structures and procedures already exist and are being used.

Delocalization of armed forces:

Delocalization of armed forces for the same purposes as for political personnel. Here again, since we want to implement the "One World, One Nation, One Love", after a while we might want to progressively integrate all armed forces worldwide to form a "global Earth army". We insist on progressively. A first step before the integration to an Earth army could be for instance the following suggestion:

African armed forces with American leadership for intervention in Asia

American armed forces with Asian leadership for intervention in Europe

European armed forces with African leadership for intervention in America

Asian armed forces with European leadership for intervention in Africa

Here too we already have the necessary structures showing it is possible: UN blue helmets and NATO. Digression/comment about NATO: it is obsolete and should have been dismantled at the end of the cold war. When the Warsaw Pact was itself terminated. Logically anyhow our point is that we already have the necessary structures, knowledge and experience that enable us to implement such a measure. Thus once again, an implementable non utopian measure.

Religious aspect:

A greater cooperation of the main religious establishments is suggested -for instance common ceremonies- to incite the believers to meet and exchange, with highest respect to the religious establishments, the author of this text would also humbly suggest to increase the integration of modern knowledge into our belief system(s).

In this document some inconsistencies are stressed and on which our religious sisters and brothers might want to make "amendments" that would be more appropriate to our modern society. We insist, this suggestion is made with highest respect. The religious aspect is detailed further in this document. We anticipate the religious world to strongly disagree with the analyses of the author. However, should he had considered the religious matter as irrelevant.

He would have not written a word about it. On the contrary approximatively a third of this document is dedicated to the religious aspect. Similarly, as for his essay on the birth of our perceptible universe, the author had much more to say than he himself had expected. Finally, we need to add that the whole process should occur in a non-profit oriented economy. Indeed, profit unavoidably leads to over-exploitation of resources and to inflation as well as to corruption and economic crises [4]. Profit in itself -as well as money- does not really exist except in our heads. Profit is a pure product of the greed of the human mind. It does not correspond to a real "material" value. Profit based systems do not take in account the actual amount of resources. Profit and added value only take in account the alleged value and amount of work invested in the production process. But there is no economy without resources. In reality all economies need resources whereas they do not need profit. Since the dawn of time we need resources to live.

But at the scale of the history of mankind we introduced the notion of profit quite recently. Profit is with absolute certainty not necessary to the functioning of a healthy and stable economy. Some voices even argue that money itself is not necessary. Profit and infinite growth mentality are rather damageable to the social stability. All economic crises we experienced such as 1929, 1973, 2008 and now-among others-tend to prove this argument right. A stable economy insuring the livelihood of all world citizens is the base for a stable society. Whether here on Earth or for our unavoidable and logical next move into space. Stability is the necessary healthy condition for our current society to access the next technological and evolutional step-the interplanetary step? Finally, we doubtlessly will need resources from Earth even long after having "colonized" our close space and possibly the solar system. Hence the need to spare them for future generations.

After all, when we more carefully pay attention to our planet, we cannot ignore and unseen that our ecosystem is a meta closed loop. Earth is nothing else than a huge biological and mineral spaceship with a 100% recycling system. A biological and mineral spaceship working on the principle of a circular economy. Our ecosystem is a perfect model of circular economy. Sustainable expansion in space leaves no choice but to reproduce this model at a smaller scale. Obviously the most reasonable and best way to achieve this goal is to learn from our ecosystem and train our recycling ability here on Earth. Hoping this makes sense to our hypothetical readers. Intense and profound Love to our hypothetical readers.

Conflict of interest:

The authors declare no conflict of interest.
